Digital Literacy Project Report

Course Code: CSE0001
Course Title: Digital Literacy

Name: Dheer Jain
Registration Number: 25BCE10072
Branch: B.Tech (Computer Science Core)
Year: 1st Year

Institution: VIT Bhopal University
Date: 31 March, 2026

INTRODUCTION

This project was completed as part of the Digital Literacy course to build awareness and practical understanding of important digital skills required by students today. In the given scenario, I worked as a “Student Digital Ambassador” whose role is to help classmates use digital tools responsibly, communicate professionally, and stay safe online. Through this portfolio, I completed five tasks based on different modules of the course. These tasks included creating a digital literacy infographic, building a professional digital portfolio, exploring collaboration platforms, learning email etiquette, and studying cybercrime awareness. All work was organized in a GitHub repository with supporting screenshots and files. This project helped me understand that digital literacy is not only about using technology, but also about using it carefully, ethically, and effectively for academic and professional growth.

TASK-1 Write-up – Digital Literacy Awareness Infographic

For Task 1, I created a one-page infographic using Canva. The infographic is titled “Digital Literacy” and was designed to spread awareness among students about the meaning and importance of digital literacy. In my design, I included four main sections: understanding the context of digital literacy, useful digital tools for students, safe internet practices, and email etiquette. I explained that digital literacy includes the ability to find, evaluate, create, and communicate information using technology while also applying critical thinking. I also mentioned useful tools such as Google Workspace, Grammarly, Notion/OneNote, Canva, and Zotero/Mendeley. For internet safety, I included points like using strong passwords, enabling 2FA, verifying sources, and avoiding sharing personal information. The final section focused on professional email habits.

The most interesting part of making this infographic was combining educational content with an attractive visual layout. I found it slightly difficult to organize all the information clearly on a single page without making it look crowded. Canva made the design process easier by providing templates, icons, and text styling options.

Task 2 Write-up – Student Digital Portfolio

For Task 2, I created or updated my profiles on GitHub, LinkedIn, and Kaggle. These three platforms are useful for students in computer science because they help build a professional digital presence from the first year itself. On GitHub, I created my profile README and added my name, branch, year, and a short statement about what I hope to learn during my B.Tech journey. GitHub is mainly used to store projects, track progress, and showcase technical work. On LinkedIn, I completed the Education section with my degree, institution name, and expected graduation year. LinkedIn is useful for professional networking, internships, and building an online identity. On Kaggle, I set up my profile to explore data science, datasets, notebooks, and beginner-level machine learning practice.

As a first-year B.Tech CSE student, I plan to use GitHub for uploading projects and assignments, LinkedIn for connecting with peers, seniors, and recruiters, and Kaggle for learning data analysis and participating in competitions in the future. These platforms will help me develop both technical skills and professional visibility over the next four years.

Task 3 Write-up – Coding & Collaboration Platforms

For Task 3, I worked on the Google Workspace Collaboration part by creating a Google Form for a Digital Literacy Awareness Quiz. The form was designed for batchmates and included exactly five questions, as required. I made sure to include both multiple-choice questions and a short-answer question so that the quiz could test both factual understanding and basic awareness. The purpose of this form was to create a simple and interactive way to spread digital literacy concepts among students. After creating the form, I linked it with the response sheet in Google Sheets so that answers could be collected and reviewed easily.

This task helped me understand how Google Forms can be used not only for surveys but also for quizzes, feedback collection, and academic collaboration. As a student, I can use this tool for class polls, event registrations, assignment feedback, and peer learning activities. The most useful learning from this task was that cloud-based tools save time, improve organization, and make collaboration easier. Google Workspace is especially helpful in academics because it allows students to create, share, and manage digital work efficiently from anywhere.

Task 4 Write-up – Professional Email & Etiquette

A common problem in digital communication happens when students send informal or unclear emails to faculty members. For example, a student may write an email without a subject line, use casual language such as “Hey,” and fail to explain the purpose properly. This can create confusion, delay a response, or leave a negative impression. Poor tone and structure may make the message seem careless or disrespectful, even if the student’s issue is genuine.

This task taught me that professional communication is very important in academic and workplace settings. A proper email should include a clear subject line, respectful greeting, concise body, and formal sign-off. I also learned that responsible social media behaviour matters because online actions affect personal reputation. Good digital etiquette helps in building trust, avoiding misunderstandings, and maintaining professionalism. Overall, this task improved my understanding of how to communicate clearly and respectfully in formal digital spaces.

Task 5 Write-up – Cybercrime Awareness

For Task 5, I worked on a case study based on phishing, especially a scholarship scam targeting students. While researching this topic, what surprised me most was how easily cybercriminals can create fake websites and emails that look almost identical to genuine government or institutional platforms. The use of urgency, official-looking logos, and financial benefits makes many students trust such messages quickly. I also learned that the consequences of phishing are not limited to money loss; they can include identity theft, loan fraud, account misuse, and emotional stress.

After studying this topic, one habit I will personally change is that I will always verify links and website domains carefully before entering any personal or banking details. I will also avoid responding to urgent messages without checking their authenticity from official sources. This task made me more aware of online risks and taught me that digital safety requires attention, patience, and smart decision-making.

Conclusion

This Digital Literacy project helped me understand that being digitally literate means much more than simply using devices or apps. It includes creating useful digital content, building a professional online presence, collaborating through online tools, communicating respectfully, and staying aware of cyber threats. Each task in this project gave me practical learning that can help me throughout my academic journey and future career. As a first-year B.Tech CSE student, I found this project very useful because it introduced me to important platforms and responsible digital habits at an early stage. Overall, this project improved my confidence in using technology in a safe, effective, and professional way.
